

Drug Treatment in Prison: An Evaluation of the RAPt Treatment Programme

An excellent analysis of UK initiatives to test prisoners for drugs and alcohol. The findings of a two-year study into the effectiveness of the RAPt drug treatment programme which enables male prisoners with self-confessed problems of substance misuse to lead a drug and alcohol-free life in prison and in the community after release. The report also assesses whether completion of the programme is associated with a reduction in the likelihood of reconviction post-release.
